

LAB: PUBLISHING TO AZURE CONTAINER REGISTRY

- In the last lab, we had seen how to democratize an application. I now want to publish that image that we have on the Linux VM that has our application onto the Azure Container registry that we created earlier on.
- See if you want, let's say other developers or other team members now have the ability to download the image that you have created for the application. So, they could also go and now create containers out of that image. We need to have that image located somewhere.
- We can make use of this private registry that's known as the Azure Container Registry.
- For that we are going to install Azure Command Line Interface (CLI) on to our virtual machine. This is a command line utility that you can use to work with your Azure based services. Hence, using this command line utility, I want to publish that image from my local machine onto the Azure Container Registry.
- For this, the first step is to go ahead and install the Azure CLI on our Linux based VM.
- In terms of installing the CLI I've used Microsoft Documentation. A copy of the first set of commands. This is to get the packages needed for the installation process.
- <https://learn.microsoft.com/en-us/cli/azure/install-azure-cli-linux?pivots=apt>
- Use the above link to go through the commands that you are going to use to install CLI. I would suggest you to use option 2 to install CLI.

Option 2: Step-by-step installation instructions

If you prefer a step-by-step installation process, complete the following steps to install the Azure CLI.

1. Get packages needed for the installation process:

```
Bash Copy  
sudo apt-get update  
sudo apt-get install ca-certificates curl apt-transport-https lsb-release gnupg
```

2. Download and install the Microsoft signing key:

```
Bash Copy  
sudo mkdir -p /etc/apt/keyrings  
curl -sLS https://packages.microsoft.com/keys/microsoft.asc |  
    gpg --dearmor |  
    sudo tee /etc/apt/keyrings/microsoft.gpg > /dev/null  
sudo chmod go+r /etc/apt/keyrings/microsoft.gpg
```

3. Add the Azure CLI software repository:

```
Bash Copy  
AZ_DIST=$(lsb_release -cs)  
echo "deb [arch=`dpkg --print-architecture` signed-by=/etc/apt/keyrings/microsoft.gpg] https://packages.  
sudo tee /etc/apt/sources.list.d/azure-cli.list
```

4. Update repository information and install the `azure-cli` package:

```
Bash Copy  
sudo apt-get update  
sudo apt-get install azure-cli
```

```
demousr@dockervm:~/publish$ sudo apt-get update  
sudo apt-get install ca-certificates curl apt-transport-https lsb-release gnupg

demousr@dockervm:~/publish$
```

- Once the CLI has installed, now we are going to make use of access keys which we can get from Container Registry.
- Go back to Azure Portal, there on the left side of the screen, look for access keys.
- In the access keys you can see your registry name and log in server.

[Home](#) > [Resource groups](#) > [app-grp](#) > [appregistry334422](#)

appregistry334422 | Access keys

Container registry

Search	Registry name	appregistry334422
Overview	Login server	appregistry334422.azurecr.io
Activity log	Admin user	(empty)
Access control (IAM)		
Tags		
Quick start		
Events		
Settings		
Access keys		
Encryption		
Identity		
Networking		
Microsoft Defender for Cloud		
Properties		
Locks		

- Now you need to click on Admin user, it will give you access to the user's name and password.

Registry name	appregistry334422	
Login server	appregistry334422.azurecr.io	
Admin user	<input checked="" type="checkbox"/>	
Username	appregistry334422	
Name	password	Regenerate
password	cl6ndn5TG9J9/20csieUy3QsytvZwgkKFtoRfCWqsd+ACRCY...	
password2	n1hdsBr0A0BthTTLfK4jCiU+vvZ2MtdWAcHDcnV16F+ACR...	

- Then after go back to your virtual machine and type a command to log in.
- sudo az login**
- Then it will give you a code and ask you to use that code on the Microsoft official website and then you will have to log in.
- For that open the website mentioned and then enter the code there, after that you need to log into your account.
- Then you will get this script written which means that you have successfully login.

```
demouser@dockervm:~/publish$ sudo az login
To sign in, use a web browser to open the page https://microsoft.com/devicelogin and enter the code GZUEXUCY6 to authenticate.
```

```
demouser@dockervm:~/publish$ sudo az login
To sign in, use a web browser to open the page https://microsoft.com/devicelogin and enter the code GZUEXUCY6 to authenticate.

}
]demouser@dockervm:~/publish$
```

- Now you need to write this code.
- sudo az acr login --name --username --password**
- After the code has successfully executed then move forward to write another code and execute that.

```
demouser@dockervm:~/publish$ sudo az acr login --name appregistry334422 --username appregistry334422 --password cl6ndn5TG9J9/20csieUy3QsytvZwgkKFtoRfCWqsd+ACRCYmRoo
Login Succeeded
WARNING! Your password will be stored unencrypted in /root/.docker/config.json.
Configure a credential helper to remove this warning. See
https://docs.docker.com/engine/reference/commandline/login/#credentials-store
```

- Now write this code and execute that.

- **sudo docker tag sqlapp appregistry10002313.azurecr.io/sqlapp**
- **sudo docker push appregistry10002313.azurecr.io/sqlapp**
- Remember to change the registry name with yours.

```
demousr@dockervm:~/publish$ sudo docker tag sqlapp appregistry334422.azurecr.io/sqlapp
demousr@dockervm:~/publish$ sudo docker push appregistry334422.azurecr.io/sqlapp
Using default tag: latest
The push refers to repository [appregistry334422.azurecr.io/sqlapp]

demousr@dockervm:~/publish$
```

- Once every code is executed go to your Container Registry and then from the left the side go to repositories.
- There you will see that a repository is saved here.
